ACOS Level 2 Standard Product Data User's Guide, v3.5

Revision Date: Revision D, March 28, 2016

**Goddard Space Flight Center
Greenbelt, Maryland**

**Jet Propulsion Laboratory
Pasadena, California**

Prepared By:

Gregory Osterman, JPL
ACOS, OCO-2 Science Validation Lead

Annmarie Eldering, JPL
OCO-2 Deputy Project Scientist

Charles Avis, JPL
ACOS, OCO-2 Science Data Operations System

Christopher O'Dell, CSU
ACOS, OCO-2 Algorithms Team

Elmain Martinez, JPL
ACOS Science Data Operations System

David Crisp, JPL
OCO-2 Science Team Lead

Christian Frankenberg, JPL
ACOS, OCO-2 Algorithms Team

Brendan Fisher, JPL
ACOS, OCO-2 Validation Team

The work, recommendations and descriptions described in this document were carried out at the Jet Propulsion Laboratory, California Institute of Technology, under a contract with the National Aeronautics and Space Administration. Additional work was performed at the Colorado St University under the ACOS project.

Revision History

Revision Date	Changes	Author
1 October 2010	Initial Release	C. Avis
20 December 2010	Updates to most sections including changes to ACOS metadata/elements based on the v2.8.00 delivery. Updated quality provided by G.Osterman.	E. Martinez
30 October 2011	Complete revision of document. Includes updates for Build 2.9	E. Martinez
29 November 2011	Rev B: Updated links to Mirador, corrected typos	E. Martinez
7 December 2011	Rev C: corrected typo on page 17 and added additional instructions on how to get data in section 4. ACOS release v2.9	E. Martinez
26 October 2012	Rev D: Updated to further describe experience with v130130 data, and the preliminary experience with v15015x. Additional information about biases between Gain H and Gain M has been added. Errors associated with geolocation uncertainties also added. ACOS release v2.9	D. Crisp
29 October 2012	Rev E: Updated for ACOS release v2.10	C. O'Dell, G. Osterman, A. Eldering, D. Crisp, C. Avis
15 April 2013	Rev F: Updated for ACOS release v3.3	C. O'Dell, G. Osterman, B. Fisher, C. Frankenberg, C. Avis
3 October 2013	Rev A: Updated for ACOS release v3.4	C. O'Dell, G. Osterman, A. Eldering
26 November 2013	Rev B: Updated for version 3.4 release-2	C. O'Dell, A. Eldering
3 January 2014	Rev C: Fixed minor typos and mistakes in bias-correction coefficients	C. O'Dell
18 March 2014	Rev D: Updated for version 3.4 release-3	C. O'Dell
14 July 2014	Rev A : Updated for ACOS release v3.5	C. O'Dell
24 July 2014	Rev B : Slight change to filtering and bias correction for v3.5	C. O'Dell
5 May 2015	Rev C : Updated to release-2 bias correction for v3.5	C, O'Dell
28 March 2016	Red D : Minor updates to this guide to reflect latest literature and guidance, table updates to reflect v3.5 product	C. O'Dell, C. Avis G. Osterman

1. Introduction

1.1. Scope and Background

This document provides an overview of the v3.5 Atmospheric CO₂ Observations from Space (ACOS) data product, key features and issues, preliminary validation information, recommendations on data usage, as well as background on the Greenhouse Gases Observing Satellite (GOSAT) mission measurements and the ACOS algorithm. The later sections provide the reader with information on filename conventions and a detailed guide to the format and fields in the hdf product.

This is the sixth 'public release' of ACOS data, the previous released version being v3.4, which was released in November 2013. The ACOS v2.10 data were unofficially released in October 2012. The v2.8 and v2.9 data are described in a series of validation papers published in 2011 and 2012. This document updates findings from these papers for v3.5, and gives more general information on the use of ACOS data.

While Build 3.5 is now relatively mature, the Build 3.5 retrievals continue to be evaluated, and the guidance provided herein may be incomplete.

1.2. Overview of Document

The remainder of this section describes the usage of the ACOS data. Section 2 provides details of the differences in this version, product characteristics, validation status, key data fields and ends with recommendations for data analysis. Section 3 provides background information on the GOSAT mission, ACOS file and data conventions, and a complete listing of metadata elements in the v3.5 ACOS data product. Section 4 lists tools to view and search the data products. Section 5 lists contact information for both GOSAT and ACOS data, and the last section lists acknowledgements and relevant publications.

1.3. Data Usage Policy

This data has been produced by the ACOS project, and is provided freely to the public. The ACOS project has been made possible by the generous collaboration with our Japanese colleagues at Japanese Aerospace Agency (JAXA), National Institute for Environmental Studies (NIES), and the Ministry of the Environment (MOE). The L1 data have been made available for this project through an RA agreement between the GOSAT Three Parties and Caltech. To improve our product and have continued support for this work, we need user feedback and also have users acknowledge data usage. Therefore, we request that when publishing using ACOS data; please acknowledge NASA and the ACOS/OCO-2 project.

- Include OCO-2 as a keyword to facilitate subsequent searches of bibliographic databases if it is a significant part of the publication
- Include a bibliographic citation for ACOS/OCO-2 data. The most relevant citations currently are Wunch et al (2011), O'Dell et al (2012) and Crisp et al. (2012).
- Include the following acknowledgements: "These data were produced by the ACOS/OCO-2 project at the Jet Propulsion Laboratory, California Institute of Technology, and obtained from the JPL website, co2.jpl.nasa.gov."
- Include an acknowledgement to the GOSAT Project for acquiring these spectra.

- We recommend sending courtesy copies of publications to the OCO-2 Project Scientist, Michael.R.Gunson@jpl.nasa.gov.

2. V3.5 ACOS L2 Data Products

2.1. Differences among ACOS versions

2.1.1. Differences Between v3.5 and v3.4

The following is a summary of the key L1B changes made in v3.5 compared to v3.4. Note that more details of the L1B versions are included in Section 3.2.

Changes to the L2 products are as follows:

- Significantly affecting the retrieval results
 - Residual EOF fitting properly trained on v161160 L1B data.
 - Use MERRA aerosol climatology to determine two prior aerosol types for each sounding, rather than always using the same aerosol types. The prior & first guess AOD for each of these two types is also take from the climatology.
 - Implemented “warn levels” in addition to empirical screening of data quality.
- Within the code
 - A small fix to the fluorescence calculation
 - Added new “xco2_gain” output variable.
 - Other minor changes not affecting the output.
- Spectroscopy
 - Minor changes were made...
- Bias Correction
 - The X_{CO2} bias correction has its overall scale factor determined from the latest version of the Total Carbon Column Observing Network (TCCON) version GGG2014, as opposed to GGG2012 (used in earlier releases).

2.2. Validation Status

The version 3.5 ACOS X_{CO2} data product has undergone a *preliminary* validation against both TCCON data and models. Detailed comparisons to TCCON have been published in Lindqvist et al. (2015) and Kulawik et al. (2016).

Data Description and User Alerts

There are some differences between the results from ACOS software build_id v3.5 and those from previous builds (which were very similar). There remains a fundamental difference between land Medium (M) and High (H) gain data, as well as ocean glint data (virtually all of which is taken in High gain). However, these differences are removed in the bias-correction, and therefore all three of these data types should be acceptable for use in inversions, though users should be aware that minor differences between the three may remain. Preliminary work has shown that persistent land-ocean XCO₂ biases will have substantial effects on flux inversions (Basu et al, 2013). The same can be expected for land gain H vs. gain M.

Data Completeness/Coverage

- GOSAT L1B Version 161160 was used for all L2 retrievals in v3.5.
- The first three months of GOSAT operations (April-May, 2009) have incomplete operational coverage due to on-orbit calibrations and checkout activities. Full coverage begins about 1 July 2009. However, L1B version 161160 do have many more soundings in April-June, 2009, than all preliminary L1B versions. The v3.5 L2 retrievals therefore also have many more L2 soundings in these months. It is not yet known what confidence can be placed in these early soundings; users should therefore exercise caution when using any data before 1 July 2009.
- Typically data products contain 10-100 useful soundings per orbit, out of the 600-700 L1B soundings collected in an orbit. Note that over 50% of the data is not processed because it does not pass the first cloud screening pre-processing step. A large fraction of data is collected over ocean but not in glint, and thus is not processed. Of the ~100 soundings that are processed for each orbit, convergence and quality screens identify about 50% of that data as good.
- If data users create maps of the filtered v3.5 carbon dioxide data, they should expect to see glint measurements move north and south during the year. Figure 1 shows maps from ACOS v2.10 data, illustrating how the glint observations change with time of year.

Chlorophyll Fluorescence

As since v3.3, solar-induced chlorophyll fluorescence is included in the full-physics code as an additional state vector element in v3.5. The main motivation is to reduce a potential bias on XCO₂, as outlined in detail in Frankenberg et al. (2012). This product, however, should not be used to look at chlorophyll fluorescence itself, as there is a high interference with other state vector elements (surface pressure, albedo, aerosols). Fluorescence is NOT fit for in gain M data over land, which is primary unvegetated desert, as well as ocean data, where the ocean fluorescence signal from phytoplankton is expected to be small.

The IMAP-DOAS preprocessor performs fluorescence retrievals using Fraunhofer lines only, which is more robust and should be used as the ACOS fluorescence product. However, the fields reported in the official level 2 file have not yet been optimally corrected for the 0-level offset observed in GOSAT O₂ A-band spectra (Frankenberg et al, 2011). A separate unofficial fluorescence dataset (monthly ascii files of single soundings) is available upon request (Christian.frankenberg@jpl.nasa.gov).

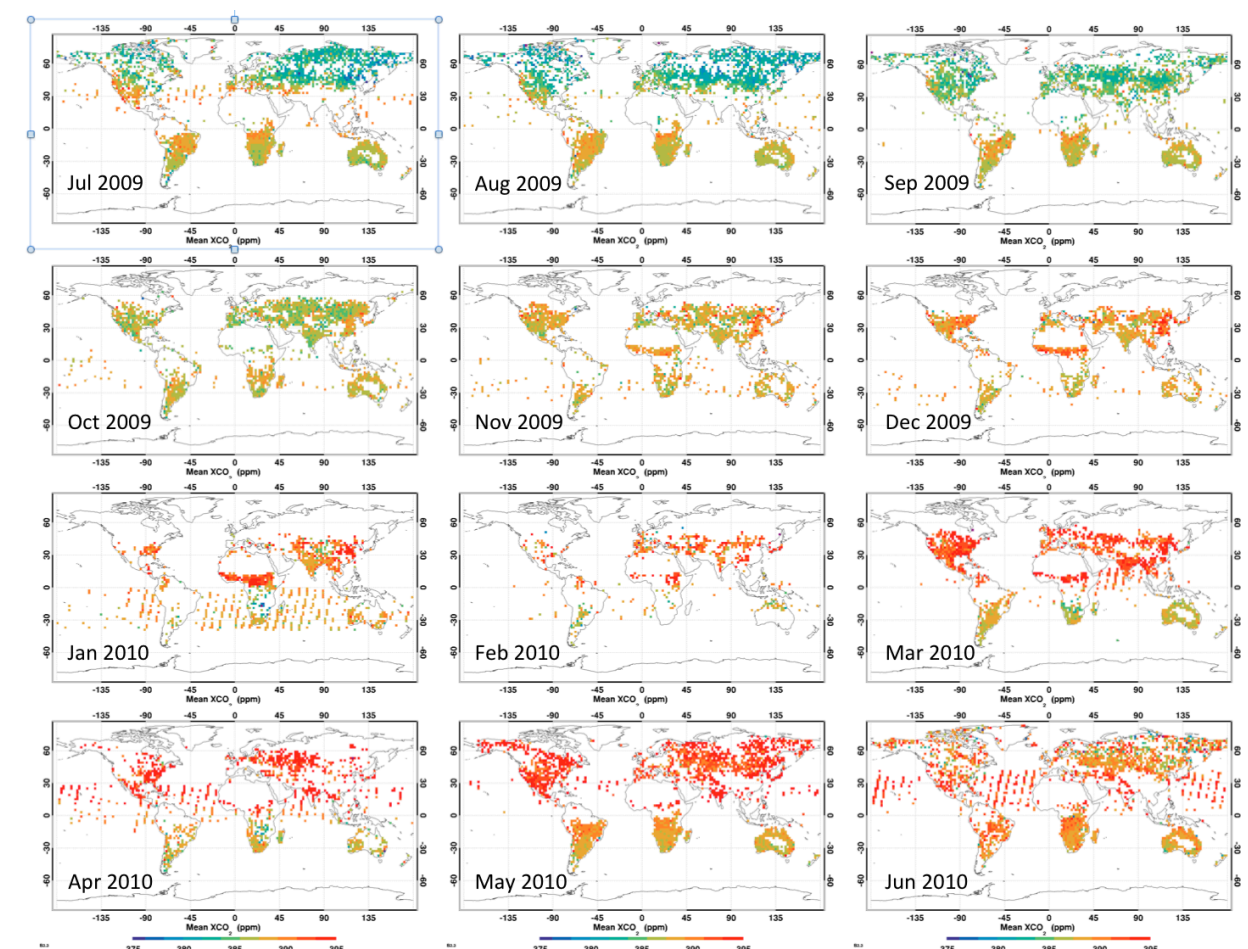

Figure 1: Monthly maps of the ACOS v2.10 X_{CO_2} data. Each data point contains the average value for X_{CO_2} estimates in a $2^\circ \times 2^\circ$ bin for that month that passed all pre- and post-screening filters; the recommend bias correction has been applied.

Cloud-Screening

- To further reduce the computation time of retrievals containing clouds, the cloud screening algorithm is applied to this version. It performs a fast, Oxygen A-band only clear-sky retrieval for surface pressure, surface albedo, temperature offset and dispersion multiplier. The retrieved surface pressure and albedo information are combined with the χ^2 goodness-of-fit statistic and signal-to-noise ratio to determine if a scene is clear(0), cloudy (1), or skipped (2). The difference of this retrieved surface pressure with respect to the prior ECMWF analysis-based estimate serves as the chief filter criterion; this difference must be less than 25 hPa for the sounding to pass the screen. See Taylor et al. (2012) for further details on the Oxygen A-band cloud-screening algorithm.

Pre-Processing for v3.5

In version v3.5, a preprocessing scheme was used that is similar to that used for the v3.3 (and earlier) ACOS data version. This is in contrast to v3.4, which used additional pre-filters to speed up processing. This additional processing speed was not necessary for v3.5, so only a mild cloud-screen was used (see above). In the case of soundings over water, a check was made to ensure the observation was made in glint mode.

Post-Processing

- No bias correction – the retrieval results in the standard HDF files have not been systematically corrected based upon some known reference source. Bias corrected XCO₂ values are provided in the ACOS v3.5 “Lite” files.
- No post-screening – the results in the standard HDF files include all soundings whose retrieval did not crash or exit with an error status. This means that even some non-converged soundings are present in the standard HDF files.
- No post-processing filter has been applied to eliminate soundings based upon certain criteria.

Quality Flagging

- There are several quality flags among the variables. The user should weigh the following information about the flags:
 - *Retrieval_header/sounding_qual_flag* – quality of input data provided to the retrieval processing
 - *Retrieval_results/outcome_flag* – retrieval quality based upon certain internal thresholds, which mainly describes where a sounding converged (outcome_flag = 1 or 2), or failed to converge (outcome_flag = 3 or 4).

Averaging Kernels

- The data files include a column averaging kernel value for each retrieved sounding.
- The normalized Averaging Kernel (*retrieval_results/xco2_avg_kernel_norm*) for a given pressure level is equal to the non-normalized value (*retrieval_results/xco2_avg_kernel*) divided by the pressure weighting function at that level. Note that levels are “layer boundaries” and have no thickness.

Known Problems

- Pointers to other files (e.g., ‘*InputPointer*’) are not useful because those files reside only on the originating system and were not delivered to the GES DISC.

2.3. Key Science Data Fields

2.3.1. RetrievalResults/xco2

The Level 2 Standard Product contains the variable XCO₂. This variable expresses the column-averaged CO₂ dry air mole fraction for a sounding. These values are determined by a full-physics retrieval and have units of mol/mol.

2.3.2. SoundingHeader/cloud_flag

The Level 2 Standard Product contains the variable *cloud_flag*. This variable expresses the result of an analysis of cloud contamination within a sounding. Every sounding of a granule will

have a value: 0 (Clear), 1 (Cloudy) or 2 (Undetermined). The values are determined by an ABO2-band-only retrieval using the FTS spectrum. The only soundings that will be processed by the L2 software are those with a value of 0 (Clear). However, this does NOT mean that all processed soundings are actually clear. Some cloudy scenes are invariably missed by the ABO2-only preprocessor, but can lead to bad XCO₂ retrievals. Therefore, users are strongly encouraged to further apply the recommended quality filters given in section 2.4.2.

2.3.3. RetrievalResults/surface_pressure_fph

The Level 2 Standard Product contains the variable *surface_pressure_fph*. This variable expresses the retrieved atmospheric pressure at the Earth's surface for a given sounding. Those soundings that did not converge will not be present. These values are determined by a full-physics retrieval and have units of Pascals.

2.4. Science Analysis Recommendations

2.4.1. Differences among releases

This represents the second release, release-2, of filtering and bias correction for the v3.5 retrievals. In general, we tried to make the filters slightly looser, as it is generally believed that some filters may have been too strict in previous versions. In the future, there may be modifications to the recommended filtration and bias correction, resulting in new releases. Note that release-2 and release-1 had identical filtering, but slightly difference bias correction formulae.

2.4.2. Recommended Data Screening

We now describe the recommended filters for science data screening. Good soundings will be those that pass all the criteria in Table 1. Note that these screenings, while similar, are distinctly different from that of v3.4. Therefore the screening for v3.5 should be used on v3.5 retrievals.

Table 1: Screening criteria for v3.5 level-2 XCO₂ retrievals

Variable	Allowed Range		
	Ocean Glint	Land H	Land M
RetrievalResults/outcome_flag	1 or 2	1 or 2	1 or 2
RetrievalResults/aerosol_total_aod	< 0.30	0.015 to 0.25	< 0.30
AOD_Sulfate	< 0.125	< 0.125	< 0.02
AOD_Dust		< 0.15	
OD_Ice_cloud		0.0015 to 0.04	< 0.05
Ice_Height	-0.1 to 0.5	< 0.475	
IMAPDOASPreprocessing/co2_ratio_idp	0.993 to 1.015	0.992 to 1.018	0.992 to 1.015
IMAPDOASPreprocessing/h2o_ratio_idp		0.83 to 1.06	0.90 to 1.05
$\Delta P_{s,old}$ [hPa]	-15.0 to 10.0	-12.0 to 4.1	-10.0 to 6.0
RetrievalResults/xco2_uncert • 10 ⁶ [ppm]		0.55 to 2.0	< 1.2
SoundingGeometry/sounding_altitude		< 3000	
SpectralParameters/signal_weak_co2_fph		< 7.5e-7	
RetrievalResults/albedo_slope_o2 • 10 ⁵		-7.5 to -1.2	

Variable	Allowed Range		
$\Delta Grad_{CO_2}$ [ppm]		-25 to 125	-30 to 90
RetrievalResults/albedo_strong_co2_fph			> 0.20
ΔP_s [hPa]			> -5.0
RetrievalResults/albedo_slope_weak_co2 • 10 ⁵	-0.1 to 1.5		
RetrievalResults/albedo_slope_strong_co2 • 10 ⁵	> 0.0		
RetrievalResults/temperature_offset_fph	> -0.9		
RetrievalResults/zero_level_offset_o2	-3.0 to 1.0		
S ₃₂	0.575 to 0.617		
$\Delta Wind$ [m/s]	-3.0 to 6.0		

Some variables in the table must be constructed directly by users of the standard L2s HDF-5 files. All these variables appear directly in the “Lite” files.

2.4.2.1. Aerosol and cloud variables filter variables

Because of the new variable aerosol types retrieved, extracting the amount of optical depth in each species is a bit trickier than in previous versions. For each sounding, there are four species of scatterers retrieved:

1. Aerosol type 1. May be type dust (DU), sulfate (SO), OC (Organic Carbon), black carbon (BC), or sea salt (SS).
2. Aerosol type 2. May be DU, SO, OC, BC, or SS, and will be different from aerosol type 1.
3. Ice cloud
4. Water cloud

The HDF-5 files specify the fitted AOD and height for each species in terms of their number (1-4). Additionally, the variable “*RetrievalResults/aerosol_types*” indicates which type each aerosol corresponds to for a given sounding.

The following variables can then be constructed for use in the filtering. Some may also be needed for the bias correction.

- ***AOD_Sulfate***. Find each sounding for which “aerosol_types” equals “SO”. For each such sounding, the AOD due to sulfate is simply “RetrievalResults/aerosol_X_aod”, where X is either type 1 or 2.
- ***AOD_Dust***. As for *AOD_Sulfate*, but the AOD where “aerosol_types” equals “DU”.
- ***OD_Ice_cloud***. Because Ice cloud is always retrieved, and it always occurs as type 3 in version v3.5, the retrieval optical depth (OD) due to Ice cloud is simply:

$$OD_Ice_Cloud = RetrievalResults/aerosol_3_aod$$

- **Ice_Height** is the central pressure location of the retrieved ice cloud type, relative to the surface pressure. It has values typically between 0 and 1, though it can go slightly negative. It is the **second** element of the vector:

$$\text{Ice_Height} = \text{RetrievalResults/aerosol_3_gaussian_log_param}$$

2.4.2.2. Other filter variables

- ΔP_s is the difference of the retrieved and prior surface pressure, given in hPa. It is constructed as

$$\Delta P_s = (P_{s,\text{retrieved}} - P_{s,\text{prior}}) * 0.01$$

where $P_{s,\text{retrieved}}$ is the retrieved surface pressure

RetrievalResults/surface_pressure_fph and $P_{s,\text{prior}}$ is the prior (meteorological) surface pressure from ECMWF (*RetrievalResults/surface_pressure_apriori_fph*).

- $\Delta P_{s,\text{cld}}$ is the difference of the retrieved and prior surface pressure from the A-band cloud-screen, expressed in hPa:

$$\Delta P_{s,\text{cld}} = \text{ABandCloudScreen/surface_pressure_delta_cloud} \cdot 0.01$$

- S_{32} is the ratio of the signal of the strong CO₂ band (band 3) to that of the weak CO₂ band (band 2):

$$S_{32} = (\text{SpectralParameters/signal_strong_co2_fph}) / (\text{SpectralParameters/signal_weak_co2_fph})$$

- **Grad_{CO2}** is the difference in retrieved CO₂ dry-air molefraction between the surface and vertical level 13. Vertical level 13 is the level with $P/P_{\text{surf}} = 12/19 = 0.631579$. This is about 630 hPa for sounding elevations near sea level. This variable is something like a “lapse rate for CO₂”. High positive or negative values of this variable are indicative of poor soundings.
- **ΔGrad_{CO2}** is the change in **Grad_{CO2}** for the retrieved value with respect to the *a priori* value. It is essentially how much the “lapse rate for CO₂” has changed from the prior value to the retrieved value, and also can be indicative of bad soundings. The CO₂ profile for the prior is stored in *RetrievalResults/co2_profile_apriori*, and the retrieved profile is stored in *RetrievalResults/co2_profile*.
- **ΔWind** is the difference between retrieved and prior wind speed for ocean glint retrievals, in m/s. It is given as

$$\Delta \text{Wind} = \text{RetrievalResults/wind_speed} - \text{RetrievalResults/wind_speed_apriori}$$

Figure 2 illustrates the filtering process for land, gain-h ACOS data.

b35_l2_landH_sif.sav Jun 1, 2009 to Mar 24, 2013; H Gain Only
Truth:tccon; N=58169; $\sigma=3.92$ ppm

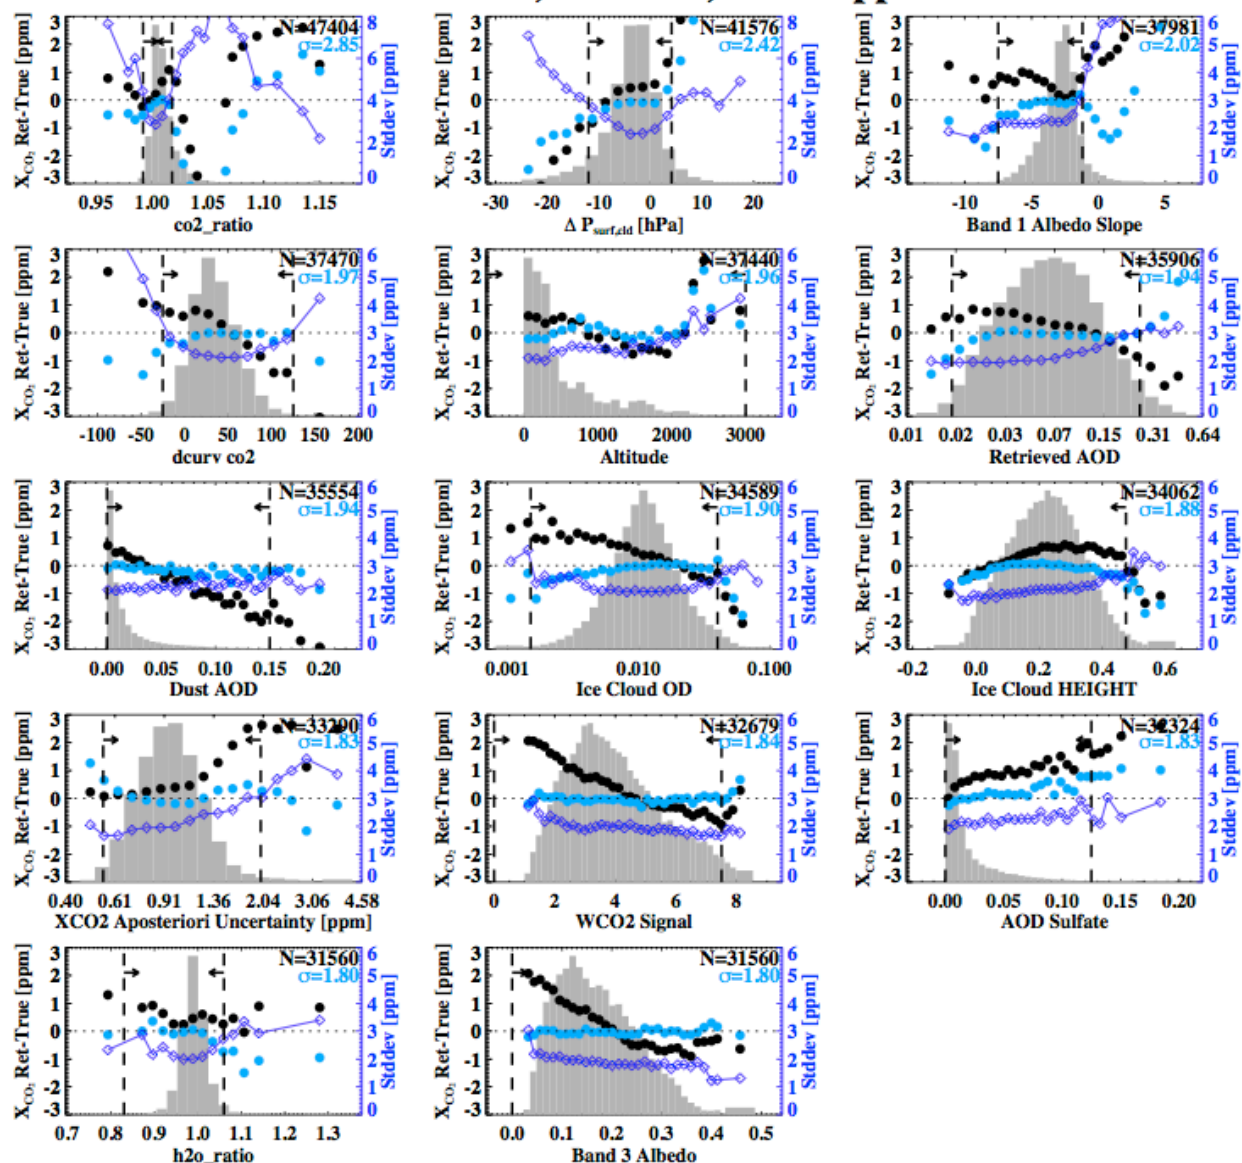

Figure 2: Plot showing the land gain H filtering process, without (black) and with (light blue) bias correction. Each panel shows the mean bias of the retrieved X_{CO_2} as evaluated against TCCON for the v3.5 dataset. The figure should be read left-to-right, top-to-bottom. Each panel shows the effect of a filter variable, applied cumulatively to all the variables that came before it. In the top right corner of each panel is displayed the number of surviving soundings after that filter has been applied (again, cumulatively), and the standard deviation of the X_{CO_2} errors for those soundings surviving to that point. The dark blue diamonds show the standard deviation of the X_{CO_2} error in each bin.

2.4.3. Recommended Bias Correction

In addition to a global bias, errors in the X_{CO_2} retrievals have been found to correlate well with certain other variables. This has been true in all previous versions of the algorithm. This issue was first explored for B2.8 and B2.9 (Wunch et al., 2011), in which four regression variables were used to correct ACOS (land, gain H) data. No correction was given for land gain M or ocean glint data at that time. This procedure was expanded in the B2.10 retrievals to also include land gain M and ocean glint soundings. There, two variables were used to bias-correct land soundings, and three were used for ocean soundings. The same methodology was followed in v3.3 for land gain H data only (as land gain M and ocean data were not trustworthy from this version), and a two-parameter bias-correction was found there. A similar procedure was followed for v3.4 for all 3 modes (land gain H, land gain M, ocean glint).

For v3.5 retrievals, we again follow the same methodology but again arrive at slightly different bias-correcting variables and coefficients as compared to v3.4. This is due to the changes in the algorithm, primarily due to the new aerosol treatment. For the bias correction formulae given below, there is some uncertainty in the fit coefficients as well as the overall mean bias. We estimate these uncertainties for each parameter and mean bias term, as rough 1-sigma uncertainties. These may be incorporated into inversion systems to formally account for these uncertainties. The uncertainties were obtained by using both models and TCCON as validation data sources, and the differences in the fit coefficients were used as a rough proxy for uncertainty.

The following bias correction formulae have been derived separately for land gain H, land gain M, and ocean glint. All formulae were derived using multiple linear regression to both TCCON, version ggg2014, and model data. Mean bias terms were estimated solely from TCCON (version ggg2014). Coefficient values and their parameters are given in Table 2.

2.4.3.1. v3.5 Release-2 bias correction (recommended)

In units of ppm, the X_{CO_2} bias correction formulae are as follows.

Land Gain H

$$\begin{aligned} X_{CO_2}' &= X_{CO_2} - 0.50 \\ &- 0.155 (\Delta P_{s,clid} + 2.7) \\ &+ 10.6 (\alpha_3' - 0.204) \\ &+ 0.0146 (\Delta Grad_{CO_2} - 35) \\ &+ 12.8 (AOD_{Dust} - 0.01) \end{aligned}$$

Land Gain M

$$\begin{aligned} X_{CO_2}' &= X_{CO_2} - 0.20 \\ &+ 0.29 (\Delta P_s + 1.2) \\ &+ 4.1 (\alpha_3 - 0.40) \\ &+ 0.015 (\Delta Grad_{CO_2} - 20) \\ &+ 7.5 (AOD_{Dust} - 0.01) \end{aligned}$$

Ocean Glint

$$\begin{aligned} X_{CO_2}' &= X_{CO_2} - 2.05 \\ &- 52 (S_{32} - 0.61) \end{aligned}$$

$$+ 0.45 (B_1 \text{Offset} + 1.0) \\ + 1.3 (\text{Ice Height} - 0.24)$$

where α_3 is the retrieved albedo in Band 2 (*RetrievalResults/albedo_strong_co2_fph*). “B₁ Offset” is found in the HDF-5 variable *RetrievalResults/zero_level_offset_o2*. All other variables were defined in the preceding section. α_3' is defined as follows:

$$\alpha_3' = \begin{cases} \alpha_3 & \text{for } \alpha_3 \leq 0.3 \\ 0.3 & \text{for } \alpha_3 > 0.3 \end{cases}$$

Some users may wish to have information regarding the uncertainty in the bias correction. This is difficult to quantify for a number of reasons. First, the validation data source (such as TCCON or the SH Approximation as used in Wunch et al., 2011) each have their own uncertainties and limitations. Training the bias correction separately on each generally results in slightly different fit coefficients. Second, the ACOS soundings themselves have errors, and incorporating all these error sources into a robust parameterization of the bias correction error is nontrivial. Therefore, the uncertainties given in Table 2 are only rough estimates, based loosely on the above considerations.

Table 2: Release-2 v3.5 bias correction parameters and their estimated uncertainties.

Bias Correction Parameters	Value \pm Uncertainty (1σ)
Land Gain H	
$\Delta P_{s,cll}$ Coefficient	-0.155 ± 0.02
α_3 Coefficient	10.6 ± 2.0
$\Delta Grad_{CO_2}$ Coefficient	0.0146 ± 0.002
AOD_Dust Coefficient	12.8 ± 2.0
Mean Bias [ppm]	-0.50 ± 0.20
Land Gain M	
ΔP_s Coefficient	0.29 ± 0.02
α_3 Coefficient	4.1 ± 2.0
$\Delta Grad_{CO_2}$ Coefficient	0.015 ± 0.002
AOD_Dust Coefficient	7.5 ± 1.5
Mean Bias [ppm]	-0.20 ± 0.40
Ocean Glint	
S_{32} Coefficient	-42 ± 8
$B_1 \text{Offset}$ Coefficient	0.62 ± 0.1
Ice_Height Coefficient	1.3 ± 0.2
Mean Bias [ppm]	-2.05 ± 0.30

2.4.4. Model-data comparisons and application to flux inversions

When comparing the ACOS XCO₂ to models, it is recommended to make use of our column averaging kernel. The ACOS level-2 retrieval first retrieves a profile of CO₂ dry-air

molefraction on twenty layer boundaries. The lowest pressure boundary is at the surface. X_{CO_2} given as:

$$X_{CO_2} = \mathbf{h} \cdot \mathbf{u} \quad (2.6)$$

where \mathbf{h} is the pressure weighting function vector and \mathbf{u} is the retrieved vector of CO_2 dry air mole fraction. In theory, we retrieve a weighted average of the true profile and our prior profile, plus a contribution from measurement noise:

$$\mathbf{u} = \mathbf{A}\mathbf{u}_{true} + (\mathbf{I} - \mathbf{A})\mathbf{u}_{ap} + \mathbf{G}\boldsymbol{\varepsilon} \quad (2.7)$$

where \mathbf{A} is the full averaging kernel matrix, \mathbf{u}_{true} is the true profile of CO_2 , \mathbf{u}_{ap} is the prior profile of CO_2 used by the L2 code, \mathbf{G} is the retrieval gain matrix, and $\boldsymbol{\varepsilon}$ is measurement noise. Hitting this equation with the pressure weighting function on the left, we arrive at a simple equation for our retrieved X_{CO_2} :

$$X_{CO_2} = \mathbf{a} \cdot \mathbf{u}_{true} + (\mathbf{h} - \mathbf{a}) \cdot \mathbf{u}_{ap} + (\mathbf{h}'\mathbf{G}) \cdot \boldsymbol{\varepsilon} \quad (2.8)$$

where \mathbf{a} is the called the (un-normalized) column averaging kernel. When comparing to models, it is useful to form the normalized column averaging kernel \mathbf{a}_{norm} , where

$$\mathbf{a}_{norm,i} = \mathbf{a}_i / \mathbf{h}_i \quad (2.9)$$

for each of our 20 levels i . When comparing model X_{CO_2} to measured, one should interpolate the model CO_2 profile to the ACOS pressure grid, and call that the truth in equation 2.8 (and setting the noise term to zero). \mathbf{h} and \mathbf{a} are both given in the data files. The vertical grid in the level-2 retrieval algorithm is a sigma pressure grid, such that the pressure at level i is given by

$$P_i = b_i P_{surf} \quad (2.9)$$

Here, P_{surf} is the retrieved surface pressure and b is vector of 20 coefficients (one for each vertical level). This is called "SigmaB" in the ACOS Lite product file. For versions v3.4 and v3.5, this vector is $\mathbf{b} = (1e-4, 1/19, 2/19, \dots, 18/19, 1.0)$.

For users need the full state vector averaging kernel and/or covariances matrices, these are available upon request (please email Christopher.ODell@colostate.edu).

2.4.5. GOSAT H- and M-Gain Data

The TANSO-FTS on the GOSAT satellite makes measurements in different modes. The different gain modes appear to suffer from slightly different biases, and the bias correction described above attempts to correction for these differences. Therefore, users should recognize that these differences exist, and while there is a bias-correction, it is not perfect and it is important to recognize that there may be residual differences in X_{CO_2} errors between these modes.

The gain setting can be determined by looking at the "RetrievalHeader/gain_swir" variable in the ACOS data product. Note that this variable has two character string entries per sounding – one for the S polarization and one for the P polarization. For ACOS retrievals, P & S polarizations have been averaged together to produce an approximation of the total intensity I.

3. Background Reading

3.1. About the GOSAT Mission

The Japanese GOSAT mission was successfully launched on January 23, 2009. The GOSAT prime mission extends five years from the date it was declared operational on April 19, 2009.

3.1.1. Instrument

The primary GOSAT science instrument is the Thermal And Near infrared Sensor for carbon Observation (TANSO). It is a Fourier-Transform Spectrometer (FTS) with 2-axis scanner. The scanner directs light into two sets of detectors within the instrument.

The Short Wave InfraRed (SWIR) detector is designed to measure the spectrum of reflected sunlight from both land and water surfaces. Three spectral regions are covered in two polarizations:

Band 1	.75 - .78 μm	Oxygen, a.k.a. ABO2
Band 2	1.56 – 1.72 μm	Weak CO ₂ , a.k.a. WCO2
Band 3	1.92 – 2.08 μm	Strong CO ₂ , a.k.a. SCO2

The Thermal InfraRed (TIR) detector is designed to measure the spectrum of thermal radiation from both land and water surfaces. A single spectral region is covered (5.5 – 14.3 μm). The ACOS Level 2 products do not include or utilize any TIR data.

Figure 3: GOSAT Observation Concept

3.1.2. Orbital Parameters

GOSAT nominal orbit parameters are shown below.

- Orbit Type: sun-synchronous, ground track repeat, near-circular orbit
- Recurrent period: 3 days
- Recurrent orbit number: 44

- Revolutions per day: 14+2/3 rev/day
- Local sun time at descending node: 12:45 – 13:15 PM
- Altitude above equator: 665.96 km
- Orbital Period: 98.1 minutes
- Inclination: 98.06 degrees
- Eccentricity: 0.0 (Frozen orbit)
- Longitude at ascending node: Longitude 4.92 degrees west for orbit 1
- Footprint size on ground: 10.5 km circle when NADIR viewing

3.1.3. Path ID Definition

The Path ID identifies the GOSAT orbit tracks on the ground. The detailed characteristics are as follows:

- A path begins at ascending node and extends to the next ascending node
- The ascending node of the Path with an ID of 1 is at longitude 4.92 degrees west
- The path number of the orbit tracks westward sequentially
- Path IDs run from 1 through 44
- Path calculator: https://data.gosat.nies.go.jp/map/html_E/MapPathCalendar.html

Note that Figure 6 illustrates 5-point sampling, which was used from April 2009 through July of 2010. Since August of 2010, a 3-point sampling mode has been used.

Points	Interval
1	789 km
3	263km
5 (nominal)	158km
7	113km
9	88km

Figure 4: GOSAT TANSO-FTS Observation Details

3.2. GOSAT L1B Releases

The L1B radiance data are provided to the ACOS project by JAXA. As instrument characteristics are better understood, there have been some changes to the L1B data. Table 3

provides a high level view of the L1B versions and key characteristics. Section 3.5.1 shows how the L1B version that was used can be identified in the L2 product file name.

3.3. About the ACOS Task

The ACOS project is part of the Earth System Science Pathfinder (ESSP) Program in the NASA Science Mission Directorate (SMD). The Orbiting Carbon Observatory (OCO) was to have been the first NASA satellite designed to make global measurements of atmospheric carbon dioxide (CO₂) sources and sinks on regional scales at monthly intervals. The failure of the launch system and loss of the observatory therefore represented a setback to NASA's carbon cycle and climate science programs.

To meet its stringent CO₂ measurement accuracy requirements, the OCO Science Team developed and implemented several significant advances in ground-based calibration, validation, and remote sensing retrieval methods. These investments were not lost in the OCO launch failure and remain valuable NASA assets.

The OCO and GOSAT Science Teams formed a close partnership in calibration and validation activities. JAXA granted the ACOS Project access to GOSAT's calibrated Level 1B measurements. The ACOS Project applies the OCO calibration, validation, and remote sensing retrieval assets to analyze these GOSAT measurements. These analyses generate the Level 2 data products described herein.

Table 3: Description of the different GOSAT L1B releases.

Version	Period YYMMDD	Changes

Version161160	090422 - 140607	<ul style="list-style-type: none"> An optical path difference (OPD) sampling interval non-uniformity correction (SINUC) was applied in L1B V150. However, a spectral ringing artifact was inadvertently introduced to the spectra in the L1B V150 processing, as 100 zeros were filled in at both ends of the interferogram. The L1B V161 processing switched off SINUC to correct this mistake An update to how the calibration of the TANSO FTS thermal infrared measurement in spectral band 4 is performed. V161 includes a more accurate polarization reflectance for each mirror.

The GOSAT team at JAXA produces GOSAT TANSO-FTS Level 1B (L1B) data products for internal use and for distribution to collaborative partners, such as ESA and NASA. These calibrated products are augmented by the ACOS Project with additional geolocation information and further corrections. These ACOS Level 1B products (with calibrated radiances and geolocation) are the input to the ACOS Level 2 production process.

The distribution of GOSAT and ACOS L1B products is currently restricted by cooperation agreements between JAXA and NASA.

3.4. ACOS Algorithms

In the sections that follow, the following definitions apply:

- Footprint – an observation by a single instrument
- Sounding – a combined observation of all instruments
- Granule – the construct expressing the content of a product (ACOS product granules contain all the processed GOSAT data for a single orbit)

3.4.1. Level 1B Algorithm Overview

The ACOS Level 1B (L1B) algorithm adds additional calibration information to the GOSAT TANSO-FTS Level 1B data, and converts these data to the format needed for the ACOS Level 2 algorithm. For example, the TANSO-FTS L1B is delivered with radiances expressed in engineering units (volts). JAXA provides a series of calibration tables that are used to convert these values from engineering units to the radiometric units used in the ACOS algorithm ($\text{photons/m}^2/\text{sr/cm}^{-1}$). The calibration information provided in these tables is derived from pre-launch calibration tests and on-orbit observations of internal light sources, deep space, the sun, the moon, and observations of calibration targets on the surface of the Earth. These tabulated results are assumed to be constant, or used to establish trends for time-dependent corrections.

Sounding and spacecraft geometric variables are included in the ACOS Level 2 products. Starting with v2.9, these geometric data are updated by the ACOS team, based on pointing error estimates provided by the GOSAT Project Team. As noted above, the pointing error tables applied to v2.9 are based on observations collected prior to December 2010, and are assumed to be constant in time. Some aspects of the geolocation is performed by the ACOS team based on standard Earth geoid shape and a high-resolution digital elevation model (DEM) and some is copied from the GOSAT input products.

ACOS does not currently process all soundings collected by GOSAT. Because the thermal IR data is not utilized in ACOS, only the soundings in the daylight portion of the GOSAT orbit are processed. This version of processing supports both nadir and glint soundings. Details of glint soundings are provided in section 2.5.2.

In addition, to restrict the attempted retrievals to those with adequate signal, the soundings are also screened by the expression “*sounding_solar_zenith* < 85”.

Performing retrievals on scenes containing clouds will either fail or have skewed results (depending upon the extent of cloud coverage). Users should check the *cloud_flag* for the ACOS estimate of scene cloudiness. Many cloudy scenes that are inadvertently passed by the cloud screen algorithm will not converge during the processing and, therefore, will not appear in the Level 2 retrieval results.

3.4.2. Level 2 Algorithm Overview

The Full-physics XCO₂ retrieval algorithm is based on the one that was to be used for the Orbiting Carbon Observatory (OCO). The algorithm is a Rodgers [2000]-type optimal estimation approach and has been described fully in O'Dell *et al.* [2011]. The retrieval algorithm consists of a forward model, an inverse method, and an error analysis step. The overall flow for the retrieval process is shown in Figure 9.

The basic idea is to use a forward model to simulate all three bands of the OCO-2 spectrum then fitting the measured spectra to the model. The forward model contains components simulating the solar spectrum, atmospheric scattering and absorption, surface optical properties, radiative transfer, and detection by the instrument. The input to the forward model consists of meteorological conditions, surface properties, characteristics of the instrument, etc. Everything that is necessary to fully simulate the as-measured radiances must be input to the forward model.

The residuals between the simulated and measured spectra are minimized by changing parameters in the state vector via the inverse method. This inversion is relatively efficient because the forward model returns not just simulated radiances, but also partial derivatives of

those radiances, also called Jacobians. The Jacobians are used by the inverse model to efficiently update the state vector in order to quickly find the state that minimizes the residuals.

Once the atmospheric state yielding the best match to the observed spectrum has been found, the algorithm then determines X_{CO_2} , errors in X_{CO_2} from different sources (such as vertical smoothing, measurement noise, etc.), and the X_{CO_2} column averaging kernel. This is necessary because x_{co2} is not itself an element of the state vector. Rather, it is determined from the profile of CO_2 , which is part of the state vector. It is formally given by the total number of CO_2 molecules in the column divided by the total number of dry air molecules in the column. This step is labeled “Error Analysis” in Figure 9.

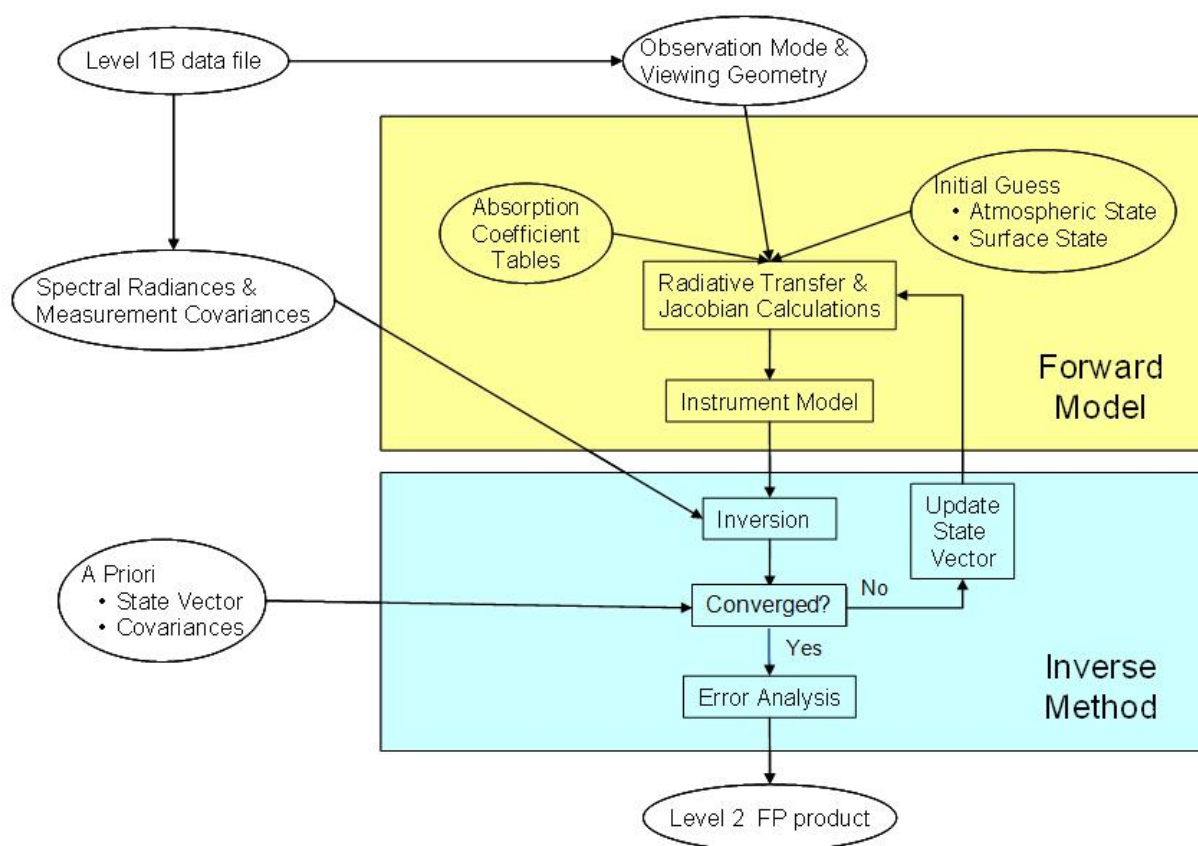

Figure 5: Level 2 Full Physics Retrieval Flow

3.5. ACOS Data Products

The ACOS Level 2 product set consists of products that focus on measuring column-averaged CO_2 dry air mole fraction (X_{CO_2}). The measurements are extracted from observations made by JAXA's Greenhouse gases Observing SATellite (GOSAT). The global coverage that is achieved by GOSAT is repeated every three days at the highest resolution yet achieved from orbit.

3.5.1. File Naming Convention

ACOS Level 2 Product file name specification:

acos_ttt_date_nn_collection_productionTimeStamp.h5

Where:

- ttt = product type (L2s)
- date = observation date (yymmdd)
- nn = GOSAT path number (01-44)
- collection label, which consists of the following elements:
 - “Production”: indicates a production product
 - v[nnn][mmm]: the TANSO-FTS L1B product version where [nnn] is the algorithm version and [mmm] is the parameter version
 - [software component][version] = the software component and version number that created the product. The software component for the final product is always ‘L2s’. The version number for this release is ‘30504’.
 - r[nn] = the reprocessing level; initial production value is always ‘01’
 - Pol[x] = the polarization used for the retrievals; possible values are S, P, or B (both)
- productionTimeStamp = production date/time (UTC) at ACOS (yymmddhhmmss)

Filename examples:

acos_L2s_090724_07_Production_v110110_L2s2800_r01_PolB_101204185614.h5

acos_L2s_101102_43_Production_v100100_L2s20900_r01_PolB_111002175250.h5

By policy, *collection* will contain the software *build_id*. In addition, *collection* will also contain a data product version *rNN* in case the same product gets regenerated.

3.5.2. File Format and Structure

All ACOS Level 2 product files are in HDF-5 format, developed at the National Center for Supercomputing Applications <http://www.hdfgroup.org/>. This format facilitates the creation of logical data structures.

All ACOS Level 2 product files contain data structures indexed by sounding (1 to N soundings/file) and are associated by the *sounding_id* variable in all products.

Variables are combined into groups by type (e.g., SoundingGeometry). Within each type, a variable has one or more values per sounding. Variables may be single-valued (e.g., *sounding_altitude*) or multi-valued (e.g., *co2_profile*).

The metadata of each variable describes the variable's attributes, such as dimensions, data representation and units.

3.5.3. Data Definition

The ACOS Level 2 products contain many variables with a variety of dimensions. The following list describes only the most important of the dimensions.

- Retrieval the number of retrievals reported (those soundings for which retrievals converged or were converging when the maximum number of iterations was reached)
- Polarization the number of polarization states
- Level the number of atmospheric retrieval levels
- Exposure the number of scans in granule
- Band the number of spectral bands
- Aerosol the number of retrieval aerosol types

3.5.4. Global Attributes

In addition to variables and arrays of variables, global metadata is stored in the files. Some metadata are required by standard conventions, some are present to meet data provenance requirements and others as a convenience to users of the ACOS Level 2 Products. The most useful global attributes present in all files are shown in Table 4. Table 5 provides a list of key metadata fields for each variable.

Table 4: Some Global Metadata Attributes

Global Attribute	Type	Description
AscendingNodeCrossingDate	String	The date of the ascending node crossing immediately before the first exposure in the TANSO-FTS file. Format: yyyy-mm-dd
AscendingNodeCrossingTime	String	The time of the ascending node crossing immediately before the first exposure in the TANSO-FTS file. Format: hh:mm:ss.sssZ
StartPathNumber	32-bit integer	The first orbital path on which data contained in the product was collected.
StopPathNumber	32-bit integer	The last orbital path on which data contained in the product was collected.
ProductionDateTime	String	The date and time at which the product was created.
CollectionLabel	String	Label associating files in a collection.
HDFVersionId	String	For example 'HDF5 1.8.5'. A character string that identifies the version of the HDF (Hierarchical Data Format) software that was used to generate this data file.
BuildId	String	The identifier of the build containing the software that created the product.
TFTSVersion	String	The version of the TANSO FTS data used to create this data product.

Table 5: Key Metadata Items

Name	Type	Description
Name	String	The name of the variable
Shape	String	The set of dimensions defining the structure
Type	String	The data representation type
Units	String	The units of the variable.
Minimum	String	Smallest valid value of the variable
Maximum	String	Largest valid value of the variable

3.5.5. ACOS Metadata and Variables

This section contains tables describing the groups of variables and metadata elements for the ACOS product.

Table 6 provides information on ACOS metadata.

Table 6: Metadata Information

Element	Storage	Comment
AbscoCO2Scale	Float32	Empirical scaling factors for CO2 ABSCO tables. Values should be different for the 1.6 micron and 2.06 micron bands and were chosen to provide agreement of retrieved XCO2 with TCCON XCO2.
AbscoH2OScale	Float32	Empirical scaling factor for H2O ABSCO tables. Currently should be 1.0.
AbscoO2Scale	Float32	Empirical scaling factor for O2 ABSCO tables. Values chosen to improve agreement between retrieved surface pressure and independent estimates from a numerical weather prediction model.
AncillaryDataDescriptors	String	An array of file names that specifies all of the ancillary data files that were used to generate this output product. Ancillary data sets include all input except for the primary input files.
AscendingNodeCrossingDate	String	The date of the ascending node crossing immediately before the first exposure in the TANSO-FTS file. Format: yyyy-mm-dd
AscendingNodeCrossingTime	String	The time of the ascending node crossing immediately before the first exposure in the TANSO-FTS file. Format: hh:mm:ss.sssZ
AutomaticQualityFlag	String	Reserved for future use.
BuildId	String	The identifier of the build containing the software that created the product.
CollectionLabel	String	Label associating files in a collection
DataFormatType	String	'NCSA HDF' - A character string that describes the internal format of the data product.
FirstSoundingId		The <i>sounding_id</i> of the first sounding in the file
GapStartTime	String	Reserved for future use.
GapStopTime	String	Reserved for future use.
GranulePointer	String	The name of the product.
HDFVersionId	String	'HDF5 vvvvvvv' - A character string that identifies the version of the HDF (Hierarchical Data Format) software that was used to generate this data file where vvvvvvv is a version id.
InputPointer	String	The name of the data product that provides the major input that was used to generate this product.
InstrumentShortName	String	'TANSO-FTS' - The name of the instrument that collected the telemetry data.
L2FullPhysicsAlgorithmDescriptor	String	A short description of the Full-Physics algorithm that was used to generate this product
L2FullPhysicsDataVersion	String	Indicates the build version number of the Full-physics algorithm used.
L2FullPhysicsExeVersion	String	Indicates the build version number of the Full-physics algorithm used.
L2FullPhysicsInputPointer	String	List of the input files used by the Full-physics algorithm code
LastSoundingId	Int64	The <i>sounding_id</i> of the last sounding in the file

Element	Storage	Comment
LongName	String	A complete descriptive name for the product.
MissingExposures	Int32	Number of expected points missing from the dataset
NominalDay	String	The approximate date on which the data were acquired. A <i>NominalDay</i> starts at an orbit boundary, so the <i>NominalDay</i> for some data do not match their calendar day. Format: yymmdd
NumberOfExposures	Int32	Actual number of points reported in the product
NumberOfGoodRetrievals	Int32	Number of retrievals with master_quality_flag of Good
OrbitOfDay	Int8	The ordinal number of the orbit within its <i>NominalDay</i> , starting with 1.
PlatformLongName	String	'Greenhouse gases Observing SATellite'
PlatformShortName	String	'GOSAT'
PlatformType	String	'spacecraft' - The type of platform associated with the instrument which acquires the accompanying data
ProcessingLevel	String	Indicates processing level. The allowed values are: Level 1A, Level 1B, Level 2
ProducerAgency	String	'NASA' - Identification of the agency that provides the project funding
ProducerInstitution	String	'JPL' - Identification of the institution that provides project management.
ProductionDateTime	String	The date and time at which the product was created.
ProductionLocation	String	Facility in which the file was produced: "Operations Pipeline", "Test Pipeline", "SCF", "Preflight Instrument Characterization", "Development", "Orbital", "Unknown"
ProductionLocationCode	String	One-letter code indicating the <i>ProductionLocation</i> . The allowed values are: "" (null string) - Operations Pipeline s - SCF t - Test Pipeline c - Preflight Instrument Characterization d - Development o - Orbital x - Unknown
ProjectId	String	'ACOS' - The project identification string.
QAGranulePointer	String	A pointer to the quality assurance product that was generated with this product.
RangeBeginningDate	String	The date on which the earliest data contained in the product were acquired. Format: yyyy-mm-dd
RangeBeginningTime	String	The time at which the earliest data contained in the product were acquired. Format: hh:mm:ss.sssZ
RangeEndingDate	String	The date on which the latest data contained in the product were acquired. Format: yyyy-mm-dd
RangeEndingTime	String	The time at which the latest data contained in the product were acquired.

Element	Storage	Comment
RetrievalIterationLimit	Int32	Maximum number of iterations allowed in the implementation of the retrieval algorithm
RetrievalPolarization	String	Polarization used in TANSO-FTS measurements in this granule - "P", "S", or "B" (for Both).
ShortName	String	The short name used to identify all data granules in a given data collection.
SISName	String	The name of the document describing the contents of the product.
SISVersion	String	The version of the document describing the contents of the product.
SizeMBECSDDataGranule	Float32	The size of this data granule in Megabytes.
SpectralChannel	String	The identifier of the spectral regions present in this granule. Allowed values are: '0.76um O2 A-band', '1.6um Weak CO2', '2.06um Strong CO2'
StartPathNumber	Int32	The first orbital path on which data contained in the product was collected.
StopPathNumber	Int32	The last orbital path on which data contained in the product was collected.
TFTSVersion	String	The version of the TANSO FTS data used to create this data product.
VMRO2	Float32	The Volume Mixing Ratio of atmospheric O2 in units of Mole Mole ⁻¹

Table 7 describes variables related to the position of the spacecraft at the observation time. Note the variables have a Shape of 'Retrieval_Array'. Therefore, soundings are included only when retrievals converged or were converging when the maximum number of iterations was reached.

Table 7: Spacecraft Geometry Variables

Element	Type	Unit	Min	Max	Comment
ground_track	Float32	Degrees	0	360	Azimuth of the spacecraft ground track (measured from North)
relative_velocity	Float32	Meters Second ⁻¹			The component of the relative SC/Target motion along the look-vector.
spacecraft_alt	Float32	Meters			Altitude of the spacecraft above the reference ellipsoid at the start of the exposure.
spacecraft_lat	Float32	Degrees	-90	90	Geodetic latitude of sub-spacecraft point at the start of the exposure.
spacecraft_lon	Float32	Degrees	-180	180	Longitude of sub-spacecraft point at the start of the exposure.
x_pos	Float32	Meters			Spacecraft position in Earth Centered Rotating (ECR) coordinates at the start of the exposure.
x_vel	Float32	Meters Second ⁻¹			Spacecraft velocity in Earth Centered Rotating (ECR) coordinates at the start of the exposure.
y_pos	Float32	Meters			Spacecraft position in Earth Centered Rotating (ECR) coordinates at the start of the exposure.
y_vel	Float32	Meters Second ⁻¹			Spacecraft velocity in Earth Centered Rotating (ECR) coordinates at the start of the exposure.

Element	Type	Unit	Min	Max	Comment
z_pos	Float32	Meters			Spacecraft position in Earth Centered Rotating (ECR) coordinates at the start of the exposure.
z_vel	Float32	Meters Second ⁻¹			Spacecraft velocity in Earth Centered Rotating (ECR) coordinates at the start of the exposure.

Table 8 describes variables related to the instrument look vector or the intersection of the look vector with the Earth surface. Note that the variables have a Shape of 'Retrieval_Array'. Therefore, soundings are included only when retrievals converged or were converging when the maximum number of iterations was reached.

Table 8: Sounding Geometry Variables

Element	Type	Unit	Min	Max	Comment
sounding_altitude	Float32	Meters			Mean altitude of the surface within the sounding based on PGS Toolkit topography
sounding_altitude_max	Float32	Meters			Maximum altitude of the surface within the sounding based on PGS Toolkit topography
sounding_altitude_min	Float32	Meters			Minimum altitude of the surface within the sounding based on PGS Toolkit topography
sounding_altitude_stddev	Float32	Meters			Standard deviation of the measure of altitude of the surface within the sounding
sounding_altitude_uncert	Float32	Meters			Uncertainty of the measure of altitude of the surface within the sounding based on the accuracy of the input information
sounding_aspect	Float32	Degree s	0	360	Azimuth of the surface projection of the slope surface normal
sounding_at_angle	Float32	Degree s	-180	180	Angle between the look vector and the spacecraft Y-Z plane. Positive angle is the right-hand screw direction of the Y-axis.
sounding_at_angle_error	Float32	Degree s	-180	180	The difference between AT value derived by MMO and actual one is stored
sounding_azimuth	Float32	Degree s	0	360	Azimuth of the vector toward the instantaneous position of the spacecraft from the center of the sounding based on topography
sounding_ct_angle	Float32	Degree s	-180	180	Angle between look vector and the spacecraft X-Z plane. Positive angle direction is the right-hand screw direction of the X-axis
sounding_ct_angle_error	Float32	Degree s	-180	180	The difference between CT value derived by MMO and actual one is stored
sounding_glint_angle	Float32	Degree s	0	180	The angle between the vector to the glint spot and the actual look vector.
sounding_land_fraction	Float32	Percent	0	100	Percent of land cover within the sounding.
sounding_latitude	Float32	Degree s	-90	90	Geodetic latitude of the center of the sounding based on PGS Toolkit topography
sounding_latitude_geoid	Float32	Degree s	-90	90	Geodetic latitude of the center of the sounding based on standard geoid
sounding_longitude	Float32	Degree s	-180	180	Longitude of the center of the sounding based on PGS Toolkit topography

Element	Type	Unit	Min	Max	Comment
sounding_longitude_geoid	Float32	Degrees	-180	180	Longitude of the center of the sounding based on standard geoid
sounding_plane_fit_quality	Float32	Meters			Standard deviation for the tangent plane approximation
sounding_slope	Float32	Degrees	0	90	Slope of the best-fit plane to the surface within the sounding.
sounding_solar_azimuth	Float32	Degrees	0	360	Azimuth of the sun at the center of the sounding based on topography
sounding_solar_zenith	Float32	Degrees	0	90	Angle between the normal to the Earth geoid and the solar angle at the center of the sounding based on topography
sounding_zenith	Float32	Degrees	0	90	The angle between the normal to the Earth geoid and the vector toward the instantaneous position of the spacecraft from the center of the sounding based on topography

Table 9 describes Sounding Header fields. They all have the Shape 'Exposure_Array' and, therefore, include all soundings.

Table 9: Sounding Header Variables

Element	Type	Comment
cloud_flag	Int8	Estimate of scene visibility for this <i>sounding_id</i> taken from an ABO2-only clear sky retrieval: 0 - Clear, 1 - Cloudy, 2 - Undetermined
l2_packaging_qual_flag	BitField8	Bit Flags are used to record the status of each sounding during packaging of l2 output into retrieval arrays. See Table 16.
retrieval_index	Int32	Index into the Retrieval dimension of arrays in the RetrievalResults group for soundings associated with retrievals.
sounding_id	Int64	The unique identifier of the sounding.

Table 10 describes data products related to cloud screening.

To further reduce the computation time of retrievals containing clouds, a cloud screening algorithm is applied to this version. It performs a fast, Oxygen A-band only clear-sky retrieval for surface pressure, surface albedo, temperature offset and dispersion multiplier. The retrieved surface pressure and albedo information are combined with the χ^2 goodness-of-fit statistic and signal-to-noise ratio to determine if a scene is clear (0), cloudy (1), or undetermined (2) as shown in Table 10. See Section 6 for a paper on this topic.

Table 10: A-Band-only Retrieval Variables

Element	Type	Comment
albedo_o2_cld	Float32	Retrieved value of lambertian surface albedo at 785 and 755 nm, respectively; from the O2 A Band cloud retrieval.
dispersion_multiplier_cld	Float64	The retrieved wavenumber multiplier to get the best fit to the O2 A band; from the A Band cloud retrieval.

Element	Type	Comment
noise_o2_cld	Float32	The noise level in the O2 A band for (P+S)/2, averaged over the spectral samples with the ten highest radiance levels.
reduced_chi_squared_o2_cld	Float32	The reduced χ^2 value of the O2 A-band clear-sky fit used in determine the presence or absence of cloud; from the O2 A Band cloud retrieval.
reduced_chi_squared_o2_threshold_cld	Float32	The threshold of reduced_chisquared_o2_cld above which cloud_flag is set to 1.
signal_o2_cld	Float32	The signal level in the O2 A band for (P+S)/2, averaged over the spectral samples with the ten highest radiance levels.
snr_o2_cld	Float32	The value of the signal-to-noise ratio of (P+S)/2, averaged over the spectral samples with the ten highest radiance levels.
surface_pressure_apriori_cld	Float32	The value of the surface pressure of the center of GOSAT's field-of-view estimated from ECMWF; from the O2 A Band cloud retrieval.
surface_pressure_cld	Float32	The retrieved value of the surface pressure; from the O2 A Band cloud retrieval.
surface_pressure_delta_cld	Float32	surface_pressure_cld - surface_pressure_apriori_cld - surface_pressure_offset_cld
surface_pressure_offset_cld	Float32	The assumed surface pressure offset for clear-sky soundings, caculated from an empirical relation based on solar zenith angle, land/water and H/M gain; from the O2 A Band cloud retrieval.
temperature_offset_cld	Float32	The retrieved offset to the assumed profile of temperature taken from the prior (ECMWF) meteorology; from the O2 A Band cloud retrieval.

The IMAP-DOAS fields are listed in Table 11.

Table 11: IMAP-DOAS Retrieval Variables

Element	Type	Comment
ch4_column_apriori_idp	Float32	A priori vertical column density of CH4 (climatology)
ch4_column_idp	Float32	Vertical column density of CH4 (weak band)
ch4_column_uncert_idp	Float32	1-sigma error in the vertical column density of CH4
ch4_weak_band_processing_flag_idp	Int8	0=processed, 1=failed, 2=not processed
cloud_flag_idp	Int8	Cloud&Aerosol filter flag; -2=unusable (outside of SZA range); -1=not all retrievals converged; 0=clearly cloudy; 1=probably cloudy; 2=probably clear; 3=very clear
co2_column_apriori_idp	Float32	A priori vertical column density of CO2 (climatology)
co2_column_ch4_window_idp	Float32	Vertical column density of CO2 retrieved in the CH4 fit window (very weak lines)
co2_column_strong_band_idp	Float32	Vertical column density of CO2 (strong band)
co2_column_strong_band_uncert_idp	Float32	1-sigma error in the vertical column density of CO2 (strong band)
co2_column_weak_band_idp	Float32	Vertical column density of CO2 (weak band)
co2_column_weak_band_uncert_idp	Float32	1-sigma error in the vertical column density of CO2
co2_ratio_idp	Float32	Ratio of retrieved CO2 column (no scattering code) in weak and strong CO2 ban
co2_strong_band_processing_flag_idp	Int8	0=processed, 1=failed, 2=not processed
co2_weak_band_processing_flag_idp	Int8	0=processed, 1=failed, 2=not processed
delta_d_idp	Float32	Deuterium depletion of total column water vapor
delta_d_uncert_idp	Float32	1-sigma uncertainty in deuterium depletion of total column water vapor
dry_air_column_apriori_idp	Float32	Integrated vertical column of dry air mass derived from meteorological data
h2o_column_apriori_idp	Float32	A priori vertical column density of H2O (based on ECMWF)
h2o_column_idp	Float32	Vertical column density of H2O

h2o_column_uncert_idp	Float32	1-sigma error in the vertical column density of H2O
h2o_ratio_idp	Float32	Ratio of retrieved H2O column (no scattering code) in weak and strong CO2 band
h2o_ratio_uncert_idp	Float32	1-sigma uncertainty in the ratio of retrieved H2O column (no scattering code) in weak and strong CO2 band
hdo_column_apriori_idp	Float32	A priori vertical column density of HDO
hdo_column_idp	Float32	Vertical column density of HDO
hdo_column_uncert_idp	Float32	1-sigma error in the vertical column density of HDO
hdo_h2o_processing_flag_idp	Int8	0=processed, 1=failed, 2=not processed
o2_ratio_p_idp	Float32	Ratio of retrieved and ECMWF O2 column retrieved in P-polarization
o2_ratio_s_idp	Float32	Ratio of retrieved and ECMWF O2 column retrieved in S-polarization
out_of_band_transmission_p_idp	Float32	Transmission at the band-pass edge, P-polarization, band 1
out_of_band_transmission_s_idp	Float32	Transmission at the band-pass edge, S-polarization, band 1
total_offset_fit_relative_755nm_p_idp	Float32	Total offset fit (0-level + fluorescence) as fraction of continuum level (755nm, P polarization)
total_offset_fit_relative_755nm_s_idp	Float32	Total offset fit (0-level + fluorescence) as fraction of continuum level (755nm, S polarization)
total_offset_fit_relative_771nm_p_idp	Float32	Total offset fit (0-level + fluorescence) as fraction of continuum level (771nm, P polarization)
total_offset_fit_relative_771nm_s_idp	Float32	Total offset fit (0-level + fluorescence) as fraction of continuum level (771nm, S polarization)

Table 12 describes the Retrieval Header, providing general characteristics of the soundings retrieved. Soundings are included only when retrievals converged or were converging when the maximum number of iterations was reached.

Table 12: Retrieval Header Variables

Element	Type	Comment
acquisition_mode	String	The instrument mode in which the data in the product were collected. Valid values are: 'OB1D', 'OB1N', 'OB2D', 'SPOD', 'SPON', 'CALM', 'LUCA'
ct_observation_points	Int8	Number of observation points in the cross track direction -1: undefined or specified observation, 0: Electrical Calibration, "0x01" : 1 points "0x03" : 3 points "0x05" : 5 points "0x07" : 7 points "0x09" : 9 points
exposure_duration	Float32	The duration of the exposure
exposure_index	Int32	The index into the Exposure dimension of arrays in SoundingHeader, SoundingGeometry, and SpacecraftGeometry groups containing the spectra used to perform the retrieval
gain_swir	String	Instrument gain setting for each polarization: H - High gain, M - Medium gain, L - Low gain, H_ERR - Error in setting high gain, M_ERR - Error in setting medium gain, L_ERR - Error in setting low gain, UNDEF - Gain set to an undefined state
glint_flag	Int8	This field is incorrect after YYYY-MM-DD. Use the glint filter described in section XXX instead of the glint_flag. Indicates whether GOSAT was in glint mode when acquiring the sounding 0 = Not in glint mode 1 = In glint mode
sounding_id_reference	Int64	The sounding_id of the sounding containing the spectra used to perform the retrieval

Element	Type	Comment
sounding_qual_flag	BitFlag32	Single-bit quality flags. See Table 16.
sounding_time_string	String	Representative sounding time, in the format yyyy-mm-ddThh:mm:ss.sssZ
sounding_time_tai93	Float64	Sounding time in number of SI seconds since midnight, January 1, 1993.
spike_noise_flag	Int8	0 - No spike noise present, 1 - Spike noise present
warn_level	Int8	Provides a value that summarizes each sounding's acceptability to a larger set of quality filters. A high warn level predicts that the sounding would fail most data filters applied to it. A low warn level suggests that the sounding would pass most quality filters that might be applied. Min=0, Max=19
zpd_saturation_flag	Int8	Copy exposureAttribute/pointAttribute/RadiometricCorrectionInfo/ZPD_SatiratopmFlag_SWI R

Table 13 describes variables expressing the retrieval results. Note that some of the variables have a Shape including 'Retrieval'. Therefore, soundings are included only when retrievals converged or were converging when the maximum number of iterations was reached.

In Table 13, $xco2$ is calculated in the following way:

$$xco2 = \sum_{i=1}^{N_{num_levels}} W_i CO2_i$$

where W_i represents $xco2_pressure_weighting_function$ and $CO2_i$ represents $co2_profile$. The sum is over num_levels . W_i is a function primarily of the pressure level spacing, but also weakly of water vapor, and also depends on surface pressure.

Table 13: Variables Expressing Retrieval Results

Element	Type	Comment
aerosol_1_aod	Float32	Retrieved total column-integrated aerosol optical depth for aerosol type 1
aerosol_1_aod_high	Float32	Retrieved column-integrated aerosol optical depth of aerosol type 1 for pressure levels less than 50,000 Pa
aerosol_1_aod_low	Float32	Retrieved column-integrated aerosol optical depth of aerosol type 1 for pressure levels greater than 80000 Pa
aerosol_1_aod_mid	Float32	Retrieved column-integrated aerosol optical depth of aerosol type 1 for pressure levels between 50,000 and 80,000 Pa
aerosol_1_gaussian_log_param	Float32	Retrieved gaussian log parameters for aerosol type 1 [total log aod, center pressure/surf-pressure, pressure sigma/surf-pressure]
aerosol_1_gaussian_log_param_apriori	Float32	a priori of retrieved gaussian log parameters for aerosol type 1
aerosol_1_gaussian_log_param_uncert	Float32	Uncertainty of retrieved gaussian log parameters for aerosol type 1

Element	Type	Comment
aerosol_2_aod	Float32	Retrieved total column-integrated aerosol optical depth for aerosol type 2
aerosol_2_aod_high	Float32	Retrieved column-integrated aerosol optical depth of aerosol type 2 for pressure levels less than 50,000 Pa
aerosol_2_aod_low	Float32	Retrieved column-integrated aerosol optical depth of aerosol type 2 for pressure levels greater than 80,000 Pa
aerosol_2_aod_mid	Float32	Retrieved column-integrated aerosol optical depth of aerosol type 2 for pressure levels between 50,000 and 80,000 Pa
aerosol_2_gaussian_log_param	Float32	Retrieved gaussian log parameters of aerosol type 2 [total log aod, center pressure/surf-pressure, pressure sigma/surf-pressure]
aerosol_2_gaussian_log_param_apriori	Float32	a priori of retrieved gaussian log parameters for aerosol type 2
aerosol_2_gaussian_log_param_uncert	Float32	Uncertainty of retrieved gaussian log parameters for aerosol type 2
aerosol_3_aod	Float32	Retrieved total column-integrated aerosol optical depth for aerosol type 3
aerosol_3_aod_high	Float32	Retrieved column-integrated aerosol optical depth of aerosol type 3 for pressure levels less than 50,000 Pa
aerosol_3_aod_low	Float32	Retrieved column-integrated aerosol optical depth of aerosol type 3 for pressure levels greater than 80,000 Pa
aerosol_3_aod_mid	Float32	Retrieved column-integrated aerosol optical depth of aerosol type 3 for pressure levels between 50,000 and 80,000 Pa
aerosol_3_gaussian_log_param	Float32	Retrieved gaussian log parameters for aerosol type 3 [total log aod, center pressure/surf-pressure, pressure sigma/surf-pressure]
aerosol_3_gaussian_log_param_apriori	Float32	a priori of retrieved gaussian log parameters for aerosol type 3
aerosol_3_gaussian_log_param_uncert	Float32	Uncertainty of retrieved gaussian log parameters of aerosol type 3
aerosol_4_aod	Float32	Retrieved total column-integrated aerosol optical depth for aerosol type 4
aerosol_4_aod_high	Float32	Retrieved column-integrated aerosol optical depth of aerosol type 4 for pressure levels less than 50,000 Pa
aerosol_4_aod_low	Float32	Retrieved column-integrated aerosol optical depth of aerosol type 4 for pressure levels greater than 80,000 Pa
aerosol_4_aod_mid	Float32	Retrieved column-integrated aerosol optical depth of aerosol type 4 for pressure levels between 50,000 and 80,000 Pa

Element	Type	Comment
aerosol_4_gaussian_log_param	Float32	Retrieved gaussian log parameters for aerosol type 4 [total log aod, center pressure/surf-pressure, pressure sigma/surf-pressure]
aerosol_4_gaussian_log_param_apriori	Float32	a priori of retrieved gaussian log parameters for aerosol type 4
aerosol_4_gaussian_log_param_uncert	Float32	Uncertainty of retrieved gaussian log parameters for aerosol type 4
aerosol_total_aod	Float32	Retrieved total column-integrated aerosol optical depth for all aerosol types
aerosol_total_aod_high	Float32	Retrieved column-integrated aerosol optical depth for all aerosol types for pressure levels less than 50,000 Pa
aerosol_total_aod_low	Float32	Retrieved column-integrated aerosol optical depth for all aerosol types for pressure levels greater than 80,000 Pa
aerosol_total_aod_mid	Float32	Retrieved column-integrated aerosol optical depth for all aerosol types for pressure levels between 50,000 and 80,000 Pa
aerosol_types	String	Retrieved aerosol types Allowed values: DU, SS, BC, OC, SO, ice, water
albedo_apriori_o2_fph	Float32	Apriori of retrieved Lambertian component of albedo at 0.77 microns
albedo_apriori_strong_co2_fph	Float32	Apriori of retrieved Lambertian componet of albedo at 2.06 microns
albedo_apriori_weak_co2_fph	Float32	Apriori of retrieved Lambertian component of albedo at 1.615 microns
albedo_o2_fph	Float32	Retrieved Lambertian component of albedo at at 0.77 microns
albedo_slope_apriori_o2	Float32	Apriori of retrieved spectral dependence of Lamberion component of albedo within o2 channel
albedo_slope_apriori_strong_co2	Float32	Apriori of spectral dependence of Lamberion component of albedo within strong co2 channel
albedo_slope_apriori_weak_co2	Float32	Apriori of retrieved spectral dependence of Lamberion component of albedo within weak co2 channel
albedo_slope_o2	Float32	Retrieved spectral dependence of Lamberion component of albedo within o2 channel
albedo_slope_strong_co2	Float32	Retrieved spectral dependence of Lamberion component of albedo within strong co2 channel
albedo_slope_uncert_o2	Float32	Uncertainty of retrieved spectral dependence of Lamberion component of albedo within o2 channel
albedo_slope_uncert_strong_co2	Float32	Uncertainty of spectral dependence of Lamberion component of albedo within strong co2 channel
albedo_slope_uncert_weak_co2	Float32	Uncertainty of retrieved spectral dependence of Lamberion component of albedo within weak co2 channel
albedo_slope_weak_co2	Float32	Retrieved spectral dependence of Lamberion component of albedo within weak co2 channel
albedo_strong_co2_fph	Float32	Retrieved Lambertian component of albedo at 2.06 microns

Element	Type	Comment
albedo_uncert_o2_fph	Float32	Uncertainty of retrieved Lambertian component of albedo at 0.77 microns
albedo_uncert_strong_co2_fph	Float32	Uncertainty of retrieved Lambertian component of albedo at 2.06 microns
albedo_uncert_weak_co2_fph	Float32	Uncertainty of retrieved Lambertian component of albedo at 1.615 microns
albedo_weak_co2_fph	Float32	Retrieved Lambertian component of albedo at 1.615 microns
apriori_o2_column	Float32	Apriori vertical column of O2
co2_profile	Float32	Vertical profile of CO ₂
co2_profile_apriori	Float32	Vertical apriori profile of CO ₂
co2_profile_averaging_kernel_matrix	Float32	Averaging kernel for co2 profile
co2_profile_covariance_matrix	Float32	Covariance matrix for co2 profile
co2_profile_uncert	Float32	Vertical profile of CO ₂ uncertainty
dispersion_offset_apriori_o2	Float64	Apriori of retrieved spectral shift in o2 channel
dispersion_offset_apriori_strong_co2	Float64	Apriori of retrieved dispersion offset term in strong co2 channel
dispersion_offset_apriori_weak_co2	Float64	Apriori of retrieved dispersion offset term in weak co2 channel
dispersion_offset_o2	Float64	Retrieved dispersion offset term in o2 channel
dispersion_offset_strong_co2	Float64	Retrieved dispersion offset term in strong co2 channel
dispersion_offset_uncert_o2	Float32	Uncertainty of retrieved dispersion offset term in o2 channel
dispersion_offset_uncert_strong_co2	Float32	Uncertainty of retrieved dispersion offset term in strong co2 channel
dispersion_offset_uncert_weak_co2	Float32	Uncertainty of retrieved dispersion offset term in weak co2 channel
dispersion_offset_weak_co2	Float64	Retrieved dispersion offset term in weak co2 channel
diverging_steps	Int16	Number of iterations in which solution diverged
dof_co2_profile	Float32	Degrees of freedom (target gas profile only)
dof_full_vector	Float32	Degrees of freedom (Full state vector)
eof_1_scale_apriori_o2	Float32	Apriori of retrieved scale factor of first empirical orthogonal residual function in o2 channel
eof_1_scale_apriori_strong_co2	Float32	Apriori of retrieved scale factor of first empirical orthogonal residual function in strong co2 channel
eof_1_scale_apriori_weak_co2	Float32	Apriori of retrieved scale factor of first empirical orthogonal residual function in weak co2 channel
eof_1_scale_o2	Float32	Retrieved scale factor of first empirical orthogonal residual function in o2 channel
eof_1_scale_strong_co2	Float32	Retrieved scale factor of first empirical orthogonal residual function in strong co2 channel
eof_1_scale_uncert_o2	Float32	Uncertainty of retrieved scale factor of first empirical orthogonal residual function in o2 channel
eof_1_scale_uncert_strong_co2	Float32	Uncertainty of retrieved scale factor of first empirical orthogonal residual function in strong o2 channel
eof_1_scale_uncert_weak_co2	Float32	Uncertainty of retrieved scale factor of first empirical orthogonal residual function in weak o2 channel

Element	Type	Comment
eof_1_scale_weak_co2	Float32	Retrieved scale factor of first empirical orthogonal residual function in weak co2 channel
fluorescence_at_reference	Float32	Retrieved fluorescence at 0.755 microns
fluorescence_at_reference_apriori	Float32	Apriori of retrieved fluorescence at 0.755 microns
fluorescence_at_reference_uncert	Float32	Uncertainty of retrieved fluorescence at 0.755 microns
fluorescence_slope	Float32	Retrieved fluorescence slope at 0.755 microns
fluorescence_slope_apriori	Float32	Apriori of retrieved fluorescence slope at 0.755 microns
fluorescence_slope_uncert	Float32	Uncertainty of retrieved fluorescence slope at 0.755 microns
h2o_scale_factor	Float32	Retrieved scale factor for h2o profile
h2o_scale_factor_apriori	Float32	Apriori of retrieved scale factor for h2o profile
h2o_scale_factor_uncert	Float32	Uncertainty of retrieved scale factor for h2o profile
iterations	Int16	Number of iterations
last_step_levenberg_marquardt_parameter	Float32	Levenberg Marquardt parameter corresponding to last iteration
num_active_levels	Int16	Number of levels in atmospheric model
outcome_flag	Int8	-2 = bad fill, -1 = packaging failure, 1 = passed internal quality check, 2 = failed internal quality check, 3 = reach max allowed iterations, 4 = reached max allowed divergences
retrieved_co2_column	Float32	Retrieved vertical column of CO2
retrieved_dry_air_column_layer_thickness	Float32	Retrieved vertical column of dry air per atmospheric layer
retrieved_h2o_column	Float32	Retrieved vertical column of H2O
retrieved_h2o_column_layer_thickness	Float32	Retrieved vertical column of H2O per atmospheric layer
retrieved_o2_column	Float32	Retrieved vertical column of O2
retrieved_wet_air_column_layer_thickness	Float32	Retrieved vertical column of wet air per atmospheric layer
specific_humidity_profile_ecmwf	Float32	ECMWF specific humidity profile interpolated to observation location, time
surface_pressure_apriori_fph	Float32	Apriori of surface pressure
surface_pressure_fph	Float32	Surface pressure
surface_pressure_uncert_fph	Float32	Apriori of surface pressure
surface_type	String	"Lambertian" or "Coxmunk,Lambertian" This element can be used to determine whether a sounding is in glint mode (Coxmunk,Lambertian) or nadir (Lambertian).
temperature_offset_apriori_fph	Float32	Apriori of retrieved offset of temperature profile
temperature_offset_fph	Float32	Retrieved offset of temperature profile
temperature_offset_uncert_fph	Float32	Uncertainty of retrieved offset of temperature profile

Element	Type	Comment
temperature_profile_ecmwf	Float32	ECMWF temperature profile interpolated to observation location, time
vector_pressure_levels	Float32	Pressure altitude corresponding to each atmospheric level
vector_pressure_levels_apriori	Float32	
vector_pressure_levels_ecmwf	Float32	Pressure altitude corresponding to each ECMWF atmospheric level
wind_speed	Float32	Retrieved Cox-Munk wind speed
wind_speed_apriori	Float32	Apriori of retrieved Cox-Munk wind speed
wind_speed_uncert	Float32	Uncertainty of retrieved Cox-Munk wind speed
xco2	Float32	Column-averaged CO2 dry air mole fraction
xco2_apriori	Float32	Apriori of column-averaged CO2 dry air mole fraction.
xco2_avg_kernel	Float32	Column averaging kernel
xco2_avg_kernel_norm	Float32	Normalized column averaging kernel
xco2_pressure_weighting_function	Float32	Pressure weighting function to form xco2
xco2_uncert	Float32	Error in column averaged target gas dry air mole fraction
xco2_uncert_interf	Float32	Variance of target gas due to interference
xco2_uncert_noise	Float32	Variance of target gas due to noise
xco2_uncert_smooth	Float32	Variance of target gas due to smoothing
zero_level_offset_apriori_o2	Float32	Apriori of retrieved zero level offset in o2 channel
zero_level_offset_o2	Float32	Retrieved zero level offset in o2 channel
zero_level_offset_uncert_o2	Float32	Uncertainty of retrieved zero level offset in o2 channel

Table 14 describes variables related to the analysis of the three spectral regions. Note that the variables have a Shape including 'Retrieval'. Therefore, soundings are included only when retrievals converged or were converging when the maximum number of iterations was reached.

In the descriptions below, "Reduced chi squared" is defined as:

$$\chi_r^2 = \frac{1}{N_{chan} - 5} \sum_{i=1}^{N_{chan}} \frac{(y_i - f_i(\hat{x}))^2}{\sigma_i^2}$$

where N_{chan} is the number of GOSAT channels in the spectral region, y_i is the radiance value measured by GOSAT in channel i , σ_i^2 is the square of the uncertainty (or noise) in channel i , and $f_i(x)$ is the model of the radiance in channel i .

Table 14: Spectral Parameter Variables

Element	Type	Unit	Comment
noise_o2_fph	Float32	$W \text{ cm}^{-2} \text{ sr}^{-1} (\text{cm}^{-1})^{-1}$	
noise_strong_co2_fph	Float32	$W \text{ cm}^{-2} \text{ sr}^{-1} (\text{cm}^{-1})^{-1}$	
noise_weak_co2_fph	Float32	$W \text{ cm}^{-2} \text{ sr}^{-1} (\text{cm}^{-1})^{-1}$	
reduced_chi_squared_o2_fph	Float32		Reduced chi squared of spectral fit for ABO2 spectral region
reduced_chi_squared_strong_co2_fph	Float32		Reduced chi squared of spectral fit for Strong CO2 spectral region
reduced_chi_squared_weak_co2_fph	Float32		Reduced chi squared of spectral fit for Weak CO2 spectral region
relative_residual_mean_square_o2	Float32		Root mean squares of residuals over signal, i.e. $\sqrt{1/N * \text{Sum}[(\text{MeasuredRadiance} - \text{ModelRadiance})/\text{signal}]^2}$ where N is the number of spectral elements in the band
relative_residual_mean_square_strong_co2	Float32		Root mean squares of residuals over signal, i.e. $\sqrt{1/N * \text{Sum}[(\text{MeasuredRadiance} - \text{ModelRadiance})/\text{signal}]^2}$ where N is the number of spectral elements in the band
relative_residual_mean_square_weak_co2	Float32		Root mean squares of residuals over signal, i.e. $\sqrt{1/N * \text{Sum}[(\text{MeasuredRadiance} - \text{ModelRadiance})/\text{signal}]^2}$ where N is the number of spectral elements in the band
residual_mean_square_o2	Float32	$W \text{ cm}^{-2} \text{ sr}^{-1} (\text{cm}^{-1})^{-1}$	Root mean squares of residuals
residual_mean_square_strong_co2	Float32	$W \text{ cm}^{-2} \text{ sr}^{-1} (\text{cm}^{-1})^{-1}$	Root mean squares of residuals
residual_mean_square_weak_co2	Float32	$W \text{ cm}^{-2} \text{ sr}^{-1} (\text{cm}^{-1})^{-1}$	Root mean squares of residuals
signal_o2_fph	Float32	$W \text{ cm}^{-2} \text{ sr}^{-1} (\text{cm}^{-1})^{-1}$	the signal level representative of the continuum level for this spectrum.
signal_strong_co2_fph	Float32	$W \text{ cm}^{-2} \text{ sr}^{-1} (\text{cm}^{-1})^{-1}$	The signal level representative of the continuum level for this spectrum.
signal_weak_co2_fph	Float32	$W \text{ cm}^{-2} \text{ sr}^{-1} (\text{cm}^{-1})^{-1}$	the signal level representative of the continuum level for this spectrum.
snr_o2_l1b	Float32		Signal-to-noise ratio for ABO2 spectral region . from the L1b processing
snr_strong_co2_l1b	Float32		Signal-to-noise ratio for Strong CO2 spectral region
snr_weak_co2_l1b	Float32		Signal-to-noise ratio for Weak CO2 spectral region

Table 15 describes bit definitions for the three variables that are constructed as bit flags.

Table 15: Bit Flag Definitions

Element	Bit #	Content
l2_packaging_qual_flag	0	Spare
	1	Spare
	2	excluded during sounding selection
	3	skipped due to missing sounding file
	4	skipped due to failed sounding file pre-check

Element	Bit #	Content
	5	failed due to sounding file read error
	6	Spare
	7	failed due to unexpected packaging error
sounding_qual_flag	0	Radiance calibration 0 = At least one band succeeded at least partially 1 = All three bands failed
	1	Geolocation 0 = Sounding geolocation succeeded 1 = Sounding geolocation failed
	2	Radiance calibration 0 = All three bands succeeded 1 = At least one band failed in at least one color
	3	Sounding geometry 0 = All parameters derived successfully 1 = Derivation failed
	4	Band ABO2 radiance calibration 0 = Successful 1 = At least on one color failed
	5	Band WCO2 radiance calibration 0 = Successful 1 = At least on one color failed
	6	Band SCO2 radiance calibration 0 = Successful 1 = At least on one color failed
	7	Sounding time derivation 0 = Successful 1 = Failed
	8	Derivation of surface parameters using DEM 0 = Successful 1 = Some parameters could not be derived
	9	Spacecraft position and velocity derivation 0 = Successful 1 = Failed
	10-31	Spare

4. Tools and Data Services

HDFView

HDFView is a Java based graphical user interface created by the HDF Group that can be used to browse all ACOS HDF products. The utility allows users to view all objects in an HDF file hierarchy, which is represented as a tree structure. HDFView can be downloaded or support found at: <http://www.hdfgroup.org/hdf-java-html/hdfview/>.

Mirador

The GES DISC provides basic temporal, advanced (event), and spatial searches through its search and download engine, Mirador (<http://mirador.gsfc.nasa.gov>). Mirador offers various download options that suit users with different preferences and different levels of technical skills. Users can start from a point where they don't know anything about these particular data, its location, size, format, etc., to quickly find what they need by just providing relevant keywords, like "ACOS", or "CO2".

Here is a direct link to the v2.9 ACOS science products on this site:

http://mirador.gsfc.nasa.gov/cgi-bin/mirador/collectionlist.pl?search=1&keyword=acos_l2s+2.9

Here are 2 methods to download the v2.9 collection:

1) Mirador Webpage

- Clicking the link above will display the collection for 2.9. Beneath the collection name, click the link "View Files"; this link will display all the files for v2.9. From here, click in the checkbox(es) to select the file(s) of interest. Click one of the buttons at the top to add the file(s) to the Cart. Doing this will update the page to show the data set collection name. On the Shopping Cart page, click the "Checkout" button. This will display the Download Data page with instructions on how to download the selected products.

2) Command-line

To build a list of ftp-paths to data files from the v2.9 collection, run the following Unix command:

```
wget "http://mirador.gsfc.nasa.gov/cgi-bin/mirador/granlist.pl?page=1&dataSet=ACOS_L2S&version=2.9&location=%28-90,-180%29,%2890,180%29&startTime=2009-03-30&endTime=2011-12-30&format=rss&maxgranules=100000" -nv -O - | sed -n '/>ftp:/ s|*</link>||gp'
```

Note the time constraints, and the version, that can be changed as appropriate. The acquired list of ftp-paths to the data files can be used in a number of ways to download the files. The most convenient would be to use "wget" from Unix command-line:

```
wget -i list_of_files.txt
```

where the list of the ftp-paths was stored in the text file "list_of_files.txt"

Global Change Master Directory

Information about GOSAT/ACOS data can be researched alongside with other relevant collections in GCMD (Global Change Master Directory):

<http://gcmd.nasa.gov/>

or

http://gcmd.gsfc.nasa.gov/getdif.htm?GES_DISC_ACOS_L2S_V2.9

5. Contact Information

Contact information of the producer of the data products:

ACOS operations team: gdsops@nephtys.jpl.nasa.gov

Contact information for interpretation and usage of the data products:

ACOS data team: acos@jpl.nasa.gov

The following list is of related organizations, web sites or publications that may be beneficial to the user.

- Japanese Aerospace Exploration Agency:
 - http://www.jaxa.jp/projects/sat/gosat/index_e.html
- Japanese National Institute for Environmental Studies:
 - http://www.gosat.nies.go.jp/index_e.html

6. Acknowledgements, References and Documentation

Acknowledgements

This research was carried out at the Jet Propulsion Laboratory, California Institute of Technology, under a contract with the National Aeronautics and Space Administration.

Figures 5 and 6 are taken from the JAXA press release “Greenhouse Gases Observing Satellite “IBUKI” (GOSAT) “First Light” Acquired by Onboard Sensors”, February 9, 2009 (JST).
